## Suggested Sequence of Topics and Learning Activities in a High School Biology Course

In the sequence proposed here, the major biological concepts build in a logical progression that uses earlier concepts to help students understand subsequent concepts and reinforces student understanding of earlier concepts as they are used in subsequent sections of the course. For example, students are introduced to DNA structure and function early in the course and then use their understanding of DNA structure and function to enhance their understanding of subsequent topics, such as genetics and cell structure and function.

These topics and learning activities are not a complete biology course, but they do provide a good basis for developing strong student understanding of a broad range of important biological concepts. The most important activities for introducing fundamental biological concepts are indicated by bold. Additional biology learning activities are available at <a href="https://serendipstudio.org/exchange/bioactivities">https://serendipstudio.org/exchange/bioactivities</a>

Each of the learning activities (except the first) will help students meet the Next Generation Science Standards (NGSS) (<u>http://serendipstudio.org/exchange/bioactivities/NGSS/listing</u>). For each of these learning activities, we present a Student Handout (which can be used as is or edited) and Teacher Notes (which include instructional suggestions and background biology). As indicated by the similar titles, some activities are available both as hands-on activities learning activities and as analysis and discussion learning activities. Most of the analysis and discussion learning activities are available as GoogleDocs.

| Tonio  | Description  | <b>Recommended Learning Activities</b>   |   |  |  |
|--|--|--|---|--|--|
| Topic  |  | Analysis and Discussion  | Hands-on Activities   |  |  |
| Characteristics of Life                          | Characteristics that distinguish living things from non-living things  | <u>Characteristics of Life</u>   |   |  |  |
| Levels of<br>Organization                        | Students are introduced to the levels of<br>organization in biology, reductionism as an<br>important approach to scientific<br>understanding, and emergent properties.   | <ul> <li><u>Levels of Organization in</u><br/><u>Biology</u></li> <li><u>Coronaviruses – What They</u><br/><u>Are and How They Can Make</u><br/><u>You Sick</u></li> </ul> |   |  |  |
| Biological<br>Molecules                          | Students learn about the chemistry and<br>functions of biological molecules. They<br>learn that proteins and DNA are not just<br>abstract concepts in biology textbooks, but<br>rather these important molecules have<br>major effects on our bodies' characteristics. | • Introduction to the<br>Functions of Proteins and<br>DNA  | <ul> <li><u>A Scientific Investigation –</u><br/><u>What types of food contain</u><br/><u>starch and protein?</u></li> <li><u>Enzymes Help Us Digest</u><br/><u>Food</u></li> </ul> |  |  |
| Introduction to<br>DNA Structure<br>and Function | Students learn about base-pairing and the<br>double helix structure of DNA. This<br>provides a basis for understanding DNA<br>replication and function. A gene is a  | <ul> <li><u>DNA Structure, Function</u><br/>and <u>Replication</u></li> <li><u>How Genes Can Cause</u><br/>Disease – Understanding</li> </ul>                              | <ul> <li><u>DNA</u></li> <li><u>How Genes Can Cause</u><br/><u>Disease – Introduction to</u></li> </ul>   |  |  |

|   | segment of DNA that gives the instructions<br>for making a protein. During transcription,<br>the sequence of nucleotides in DNA<br>determines the sequence of nucleotides in<br>mRNA. During translation, the sequence of<br>nucleotides in mRNA determines the<br>sequence of amino acids in a protein. The<br>sequence of amino acids determines the<br>structure and function of the protein.  | <u>Transcription and</u><br><u>Translation</u>  | T<br>T                                 | <u>Franscription and</u><br>Franslation   |
|---|---|---|--|---|
| Structure<br>and Function of<br>Cells, Organs<br>and Organ<br>Systems | Students investigate how phospholipids and<br>proteins combine to form the selectively<br>permeable cell membrane, which regulates<br>what gets into and out of the cell. Students<br>learn how organelles cooperate to<br>accomplish the multiple functions of a<br>living cell. Students analyze examples of<br>the relationship between structure and<br>function in diverse eukaryotic cells, the<br>small intestine, and the digestive system. | <ul> <li>Introduction to Cells</li> <li>Structure and Function of<br/>Cells, Organs and Organ<br/>Systems</li> <li>COVID-19 Vaccines – How<br/>do they work?</li> </ul>   | • <u>I</u> I<br>• <u>C</u><br><u>a</u> | ntroduction to Osmosis<br>Cell Membrane Structure<br>and Function                                   |
| Homeostasis   | Students learn how negative feedback helps to maintain homeostasis.   | • <u>Negative Feedback</u> ,<br><u>Homeostasis, and Positive</u><br><u>Feedback</u>   | • N<br>H<br>F                          | <u>Negative Feedback,</u><br><u>Iomeostasis and Positive</u><br>Feedback – Examples and<br>Concepts |
| Energy and<br>Biological<br>Processes                                 | To understand how organisms use energy,<br>students first learn how the hydrolysis of<br>ATP provides the energy for many<br>biological processes. Then, students learn<br>how cellular respiration produces ATP.<br>Finally, students learn how photosynthesis<br>produces sugars which are used both for<br>cellular respiration and for biosynthesis to<br>produce biomass.  | <ul> <li>How do organisms use<br/>energy?</li> <li>Using Models to Understand<br/>Cellular Respiration</li> <li>Using Models to Understand<br/>Photosynthesis</li> <li>Photosynthesis and Cellular<br/>Respiration –<br/>Understanding the Basics of<br/>Bioenergetics and<br/>Biosynthesis</li> <li>Where does a tree's mass<br/>come from?</li> </ul> | • P<br>R<br>G                          | Photosynthesis, Cellular<br>Respiration and Plant<br>Growth   |

| Mitosis,<br>Meiosis and<br>Fertilization | Students learn how the cell cycle produces<br>genetically identical daughter cells. They<br>use model chromosomes to understand how<br>DNA replication and mitosis ensure that<br>each new cell gets a complete set of<br>chromosomes with a complete set of genes.<br>Then, students use model chromosomes to<br>understand how meiosis produces haploid<br>gametes. Finally, students model meiosis<br>and fertilization in a format that mimics a<br>Punnett square. Thus, students develop a<br>basic understanding of how genetic<br>information is passed from one generation | <ul> <li>Food, Energy and Body<br/>Weight</li> <li>How do muscles get the<br/>energy they need for physical<br/>activity?</li> <li>Mitosis and the Cell Cycle –<br/>How the Trillions of Cells in<br/>the Human Body Developed<br/>from a Single Cell</li> <li>Understanding How Genes<br/>are Inherited via Meiosis<br/>and Fertilization</li> <li>Melanoma, Mutations and<br/>Abnormal Cell Cycles</li> <li>How Mistakes in Meiosis Can<br/>Result in Down Syndrome or<br/>Death of an Embryo</li> </ul> | • | <u>Mitosis – How a Single Cell</u><br><u>Develops into the Trillions</u><br><u>of Cells in a Human Body</u><br><u>Meiosis and Fertilization –</u><br><u>Understanding How Genes</u><br><u>Are Inherited</u> |
|--|---|--|---|---|
| Genetics                                 | to the next.<br>Students learn (1) how genotype influences<br>phenotype via the effects of genes on<br>protein structure and function and (2) how<br>genes are transmitted from parents to<br>offspring through the processes of meiosis<br>and fertilization. Students analyze the<br>probabilistic patterns of inheritance and<br>Punnett square predictions. Additional<br>concepts covered include polygenic<br>inheritance, incomplete dominance, and co-<br>dominance.  | <ul> <li>Introduction to Genetics –<br/>Similarities and Differences<br/>between Family Members</li> <li>The Genetics of Sickle Cell<br/>Anemia and Sickle Cell Trait</li> <li>Genetics and Probability –<br/>Sex Ratios of Births</li> <li>A mistake in copying DNA<br/>can result in dwarfism.</li> <li>Soap Opera Genetics –<br/>Genetics to Resolve Family<br/>Arguments</li> </ul>  | • | Genetics<br>Were the babies switched? –<br>The Genetics of Blood Types  |
| Molecular<br>Biology                     | Students learn more about molecular<br>biology and are introduced to genetic<br>engineering.  | <ul> <li><u>Mutations and Muscular</u><br/><u>Dystrophy</u></li> <li><u>Cell Differentiation and</u><br/><u>Epigenetics</u></li> </ul>   |   |   |

|   |   | <ul> <li><u>Genetic Engineering</u><br/><u>Challenge</u></li> <li><u>Gene Editing with CRISPR-</u><br/><u>Cas</u></li> </ul>  |                                     |
|---|---|---|-------------------------------------|
| Evolution   | Students develop a basic understanding of<br>natural selection. Then, students use their<br>understanding of natural selection to<br>understand several examples of evolution.  | <ul> <li>What is natural selection?</li> <li>Natural Selection and the<br/>Peppered Moth</li> <li>Evolution of Fur Color in<br/>Mice – Mutation,<br/>Environment and Natural<br/>Selection</li> <li>Coronavirus Evolution and<br/>the COVID-19 Pandemic</li> <li>How Whales Evolved –<br/>Evidence and Scientific<br/>Arguments</li> <li>How Eyes Evolved –<br/>Analyzing the Evidence</li> </ul> | • Evolution by Natural<br>Selection |
| Population<br>Growth                                  | Students learn how processes at the<br>organism level result in exponential and<br>logistic population growth. Then, students<br>analyze examples where the trends in<br>population size do not match the<br>predictions of the exponential or logistic<br>population growth models. They learn that<br>models are based on simplifying<br>assumptions and a model's predictions are<br>only accurate when the simplifying<br>assumptions are true for the population<br>studied. | <u>Understanding and</u><br><u>Predicting Changes in</u><br><u>Population Size –</u><br><u>Exponential and Logistic</u><br><u>Population Growth Models</u><br><u>vs. Complex Reality</u>  |                                     |
| Ecological<br>Succession vs.<br>Stable<br>Communities | Students analyze multiple types of evidence<br>to understand how ecological relationships<br>contribute to stability or change in<br>biological communities.  | <u>Stability and Change in</u><br><u>Biological Communities</u>   |                                     |

| Food Webs | Students learn about food webs and how<br>interactions in food webs can influence<br>trends in population size. Then, students<br>use their understanding of trophic<br>relationships in food webs, photosynthesis<br>and cellular respiration to develop an<br>understanding of energy flow through<br>ecosystems, carbon cycles, and trophic<br>pyramids. Thus, students use their<br>understanding of processes at the cellular-<br>molecular and organismal levels to<br>understand several ecological phenomena. | • | Carbon Cycles and Energy<br>Flow through Ecosystems<br>and the Biosphere<br>Trophic Pyramids<br>Food, the Carbon Cycle and<br>Global Warming – How can<br>we feed a growing world<br>population without increasing<br>global warming? | • | <u>Food Webs, Energy Flow,</u><br><u>Carbon Cycle and Trophic</u><br><u>Pyramids</u> or<br><u>Food Webs – Understanding</u><br><u>What Happened When</u><br><u>Wolves Returned to</u><br><u>Yellowstone</u> |
